

Practice Graded Assignment: Course project

✦ AI Grading

After submitting your assignment and completing your required peer reviews, you'll receive an AI-generated grade based on the assignment rubrics. You'll then have the option to have your assignment reviewed by your peers instead.

Your data will be used in accordance with [Coursera's Privacy Notice](#).

Instructions My submission Peers to review Discussions

In this project, you will demonstrate your ability to perform the following in Azure Active Directory (Azure AD):

- Create and manage users and groups
- Manage authentication

You will create a **Project solution document** that documents the steps and screenshots for performing the activities for securing access with Azure Active Directory (Azure AD.) The activities include:

- Creating users
- Creating groups
- Assigning users to groups
- Enabling and testing self-service password reset
- Enabling and verifying multifactor authentication

At the end of this project, you will have the following deliverable for submission:

- Project solution document.docx

As part of this project, you will also review the assessment submission of two (2) peers using the peer review rubric provided.

You should budget about thirty (30) minutes to complete this project. Also, allow up to one hour to complete the graded quiz that follows the project.

^ Step-By-Step Assignment Instructions

Refreshing your knowledge

Before starting on the project or while doing the project, you can refresh your knowledge by referring to the exercise/solution documents of the following lessons:

- Week 1, Lesson 3: Create and manage users in Azure Active Directory
- Week 1, Lesson 4: Manage groups and administrative units in Azure Active Directory
- Week 2, Lesson 1: Enable users to unlock their account
- Week 2, Lesson 2: Implement and test multifactor authentication

Project scenario

In this project, you will go through the typical activities that an Azure security engineer would perform in an organization.

Imagine you have recently joined a large organization as an Azure security engineer. You have been assigned the responsibility for the following:

- The organization has created a new department called DevSupport. Three new employees, John, Dave, and Jeff, have joined as part of the new department. You are responsible for creating user accounts for these employees on Azure Active Directory (Azure AD.) You should also create a group for the department and assign the users to the new group.
- The organization's employees regularly call the support team to reset their passwords. This adds to the workload of support teams and delays employees in their duties. You are responsible for enabling self-

service password reset so that users or the organization can self-authenticate with Azure AD to reset their own passwords.

- The organization has decided to enhance the security of its systems and data. You have been assigned to enable and configure multifactor authentication for the new employees to facilitate this.

Setting up the system

This project consists of tasks you should complete on the Azure platform itself. Before you begin, you must have the following:

- Access to an Azure Active Directory instance as a Global Administrator
- An application such as Snipping Tool to capture screenshots
- An application such as Microsoft Word to create a document and include the steps and screenshots for the project tasks

Guidelines for the deliverable

We have provided a template to help you create the Project solution document. The template is called "Project Solution Template.docx."

Follow these instructions to understand the required format of your deliverable.

- Open the template using the **Project Solution Template** link.

Project Solution Template
DOCX File

- Create a copy of the template on your device. For example, save it on your desktop or Microsoft OneDrive.
- Give your template copy a unique file name so that you can easily find and upload it for submission later. For example, "Course 1_Project solution document_YourInitials."

Guidelines for screenshots

Follow the below guidelines for screenshots:

- Use an application such as Snipping Tool.
- Perform a step in the task and capture the screenshot.
- Confirm that the screenshot is clear enough to display the result of your activity. It is a good idea to set your system display resolution to 1920 × 1080.
- You may also want to blur or remove personal information in the screenshot.
- Copy and paste this screenshot below the appropriate step in your version of the Project solution document.

Completing the project tasks

Follow the instructions below to create your project deliverable.

Task 1: Add a new user

Activity: Create Azure AD user accounts for the three new employees, John, Dave, and Jeff, who have joined your organization.

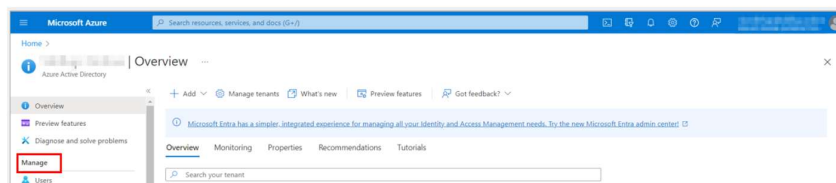

While performing this activity, take screenshots of your steps to add the new users. Include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing the Azure AD accounts of all three users.

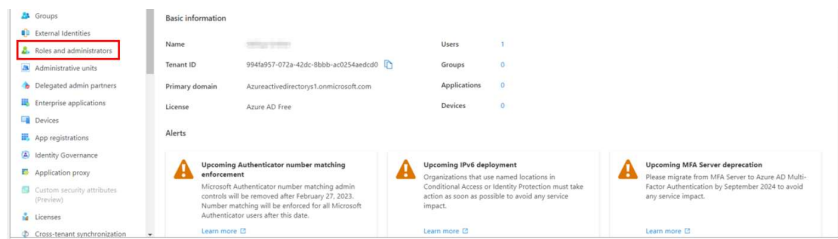

You can use the format in the following example to document the steps and add screenshots.

Example:

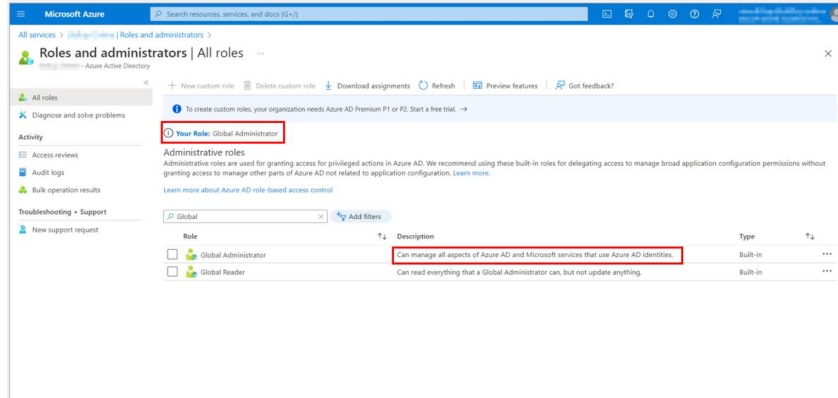

Task 1: Add a new user

1. Sign in to the Azure portal with your login credentials. Navigate to the Azure Active directory. Select Roles and administrators under the Manage blade.

2. To create a user, check your role. If your role is Global Administrator, you can manage all aspects of Azure AD.

Document steps and screenshots in this format for all the tasks.

Task 2: Create a group called DevSupport and add members

Activity: Create an Azure group called DevSupport and assign the three users, John, Dave, and Jeff, to this group.

Remember to include the activities/steps and the associated screenshots in your copy of the Project solution document. Also, include the final screenshot showing the DevSupport group in Azure AD. Creating a well-formatted document with steps and screenshots will help your peer effectively review your assignment.

Task 3: Enable self-service password reset

Activity: Enable self-service password reset for the users assigned to the DevSupport group.

Remember to include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot that shows that the self-service password reset feature is enabled.

Task 4: Test self-service password reset

Activity: Sign in as John, Dave, or Jeff (a non-administrator user) and test to confirm that you have enabled the self-service password reset option correctly.

Remember to include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing that the user can now change the password themselves.

Task 5: Enable and configure multifactor authentication for a user

Activity: Enable and verify multifactor authentication for the users John, Dave, and Jeff.

Remember to include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing that multifactor authentication has been enabled for John, Dave, and Jeff.

Finalizing your assignment

You have completed Tasks 1 to 5 and can finalize your deliverable. Ensure that you have added the steps and screenshots of all the tasks.

Remove any instruction sections or examples provided in the original deliverable template. Your final deliverable should contain only your work. You are then ready to upload your deliverable in **My submission**.

Grading Criteria Overview

There are ten (10) points for this final project. The points are distributed across the five tasks that you have

completed while developing the following deliverable:

- Project solution document (10 pts)

Here is the distribution of points across these tasks:

Task 1: Add a new user (2 pts)

Activity: Create Azure AD user accounts for three new employees, John, Dave, and Jeff, who have joined your organization.

Task 2: Create a group called DevSupport and add members (2 pts)

Activity: Create an Azure AD group called DevSupport and assign the three users, John, Dave, and Jeff, to this group.

Task 3: Enable self-service password reset (2 pts)

Activity: Enable self-service password reset for the users assigned to the DevSupport group.

Task 4: Test self-service password reset (2 pts)

Activity: Sign in as John, Dave, or Jeff (a non-administrator user) and test to confirm that you have enabled the self-service password reset option correctly.

Task 5: Enable and configure multifactor authentication for a user (2 pts)

Activity: Enable and configure multifactor authentication for users John, Dave, and Jeff.

^ Preparing for project submission

Do not proceed to **My submission** and **Peers to review** until you have completed the following deliverable:

- Project solution document

Review, proofread, and edit your deliverables to be high-quality and ready to submit to your peer.

You will submit the deliverable by uploading your files to the Coursera platform, following My submission and Peers to review prompts.

^ Peer review

Giving, receiving, and incorporating feedback is a crucial professional skill. After you submit your deliverable in the next activity, you will review and provide feedback on submissions from two other learners. In the same process, your work will be reviewed by a peer. We've shared a rubric or review guide to help you conduct your review. You will be presented with a series of questions to answer about your peers' assignment submissions. For example, did your peer complete the activity fully? For some questions, you will provide more in-depth, written feedback. Provide constructive feedback to help your peers understand what they did well and what areas they can improve.

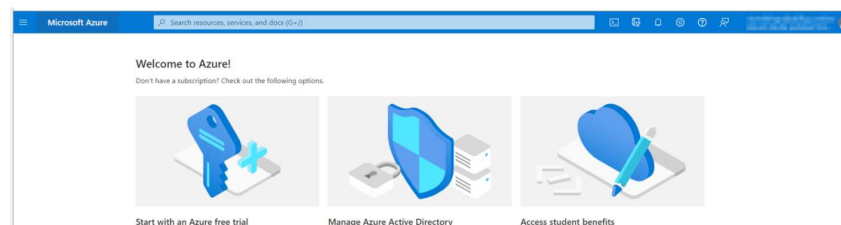

^ Compare your work (Discussion)

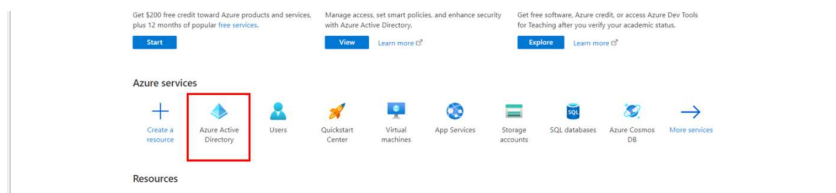

After submitting your deliverable and completing peer reviews, you can access a completed best practice sample of the project solution document. You can compare this sample to your submission, then reflect on and share your assignment experience with other learners in a discussion.

^ After completion of the project

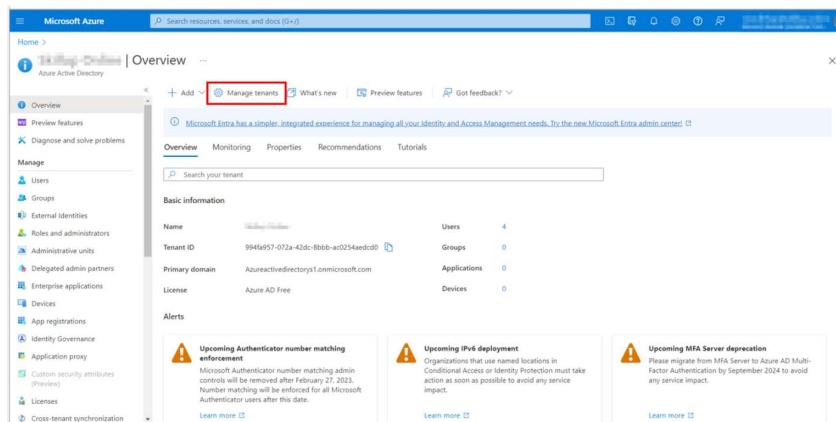

When working on your subscription, assessing whether you still require the resources you created at the end of a project is a good idea. Running resources can cost you money. You can delete resources individually or the entire resource group containing the resources. Here is how you would do this.

1. Navigate to Azure Active Directory.

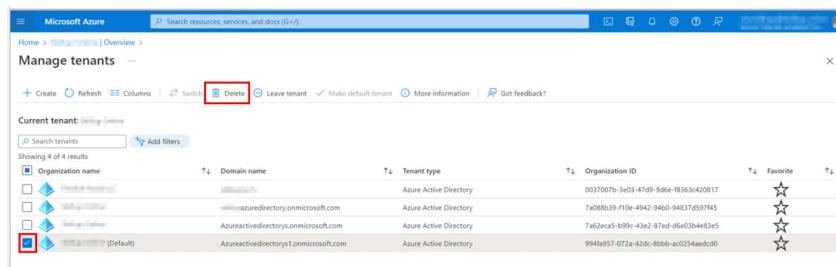

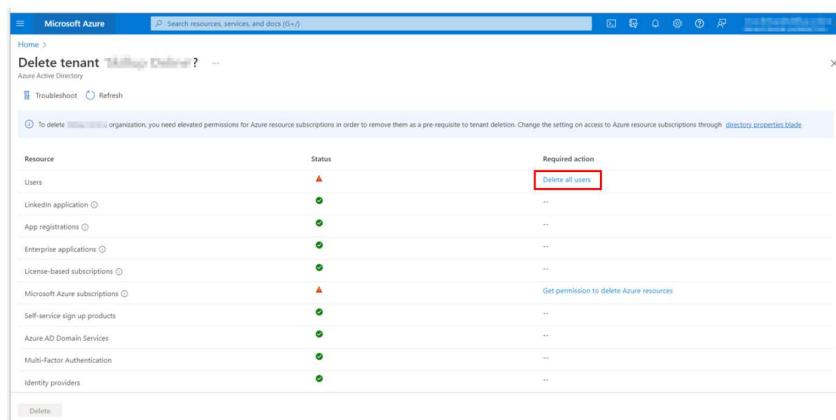

2. Select the **Manage tenants** option.

3. Select the Azure Active Directory you want to delete and select **Delete**.

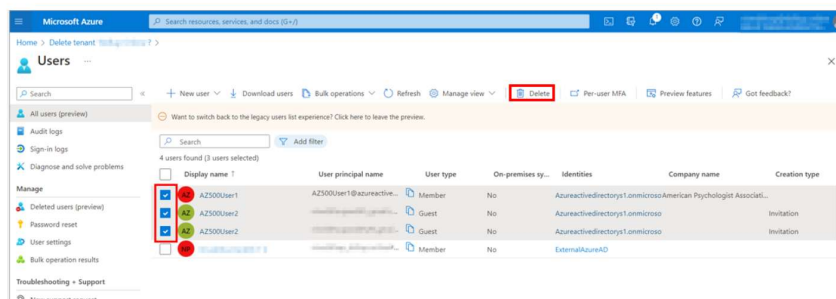

4. The **Delete tenant** screen loads up. If any other resources, such as users or applications, are present, you must delete them before deleting the Azure Active directory. For instance, if you have created users under your Active Directory, select the **Delete all users** link.

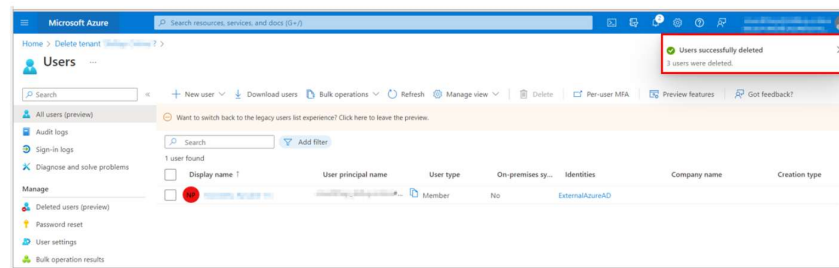

5. The **Users blade** page loads up. Here you can select the list of users you want to delete and select the **Delete** option.

Note: You should not select the user who has created the Azure Active Directory.

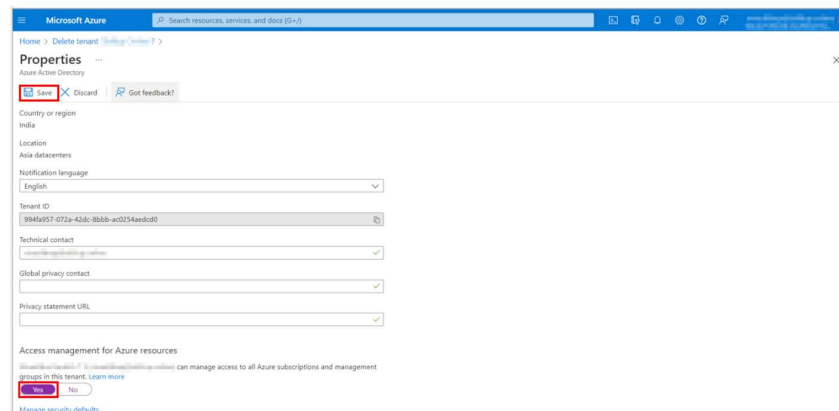

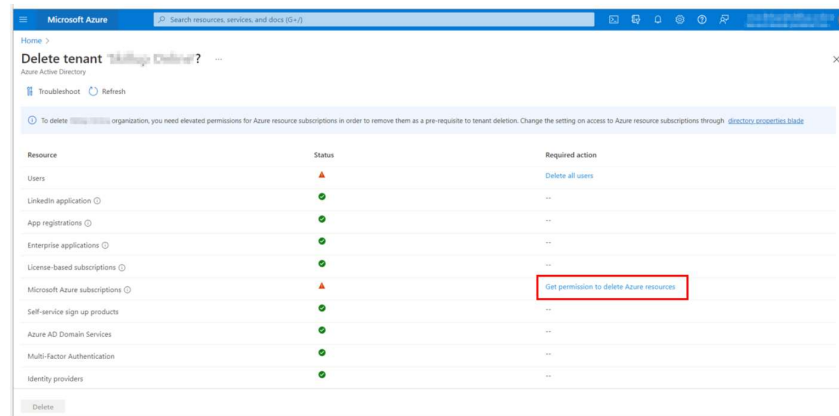

6. The users are successfully deleted.

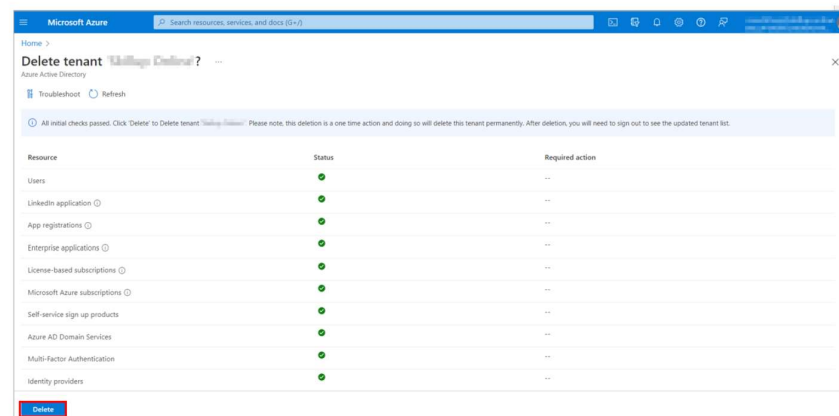

7. Further, you must be a Global Administrator to delete an Azure Active Directory.

Check the properties under the Azure Active Directory to check the Access Management for Azure resources. You should set the toggle to Yes.

8. Once all the checks are passed in the **Delete tenant** page, delete the Azure Active directory and its resources by selecting the **Delete** button.

9. The tenant gets successfully deleted.
