

Solution template: Course project

Instructions: For each of the tasks, list the steps you will perform in the system to complete the task. You can add more rows as needed. Provide screenshots of the activities. For your reference, we have filled in the information for the first two steps in Task 1 as a sample.

Task #	Activity
Task 1: Add a new user	- Sign in to the Azure portal with your login credentials. Navigate to Azure Active Directory. Select Roles and administrators under the Manage blade.  - To create a user, check your role. If your role is listed as Global Administrator, you can manage all aspects of Azure AD.

📘 To create custom roles, your organization needs Azure AD Premium P1 or P2. Start a free trial. →

🕒 Your Role: Global Administrator

Administrative roles

Administrative roles are used for granting access for privileged actions in Azure AD. We recommend using these built-in roles for delegating access to manage broad application configuration permissions without granting access to manage other parts of Azure AD not related to application configuration. [Learn more.](#)

Multifactor authentication

Enhance the security and convenience of your data and applications. Multifactor authentication reduces organizational risk and helps enable regulatory compliance by adding an extra layer of authentication, in addition to a user's account credentials, to secure employee, customer, and partner access. This Azure service can be used for on-premises and cloud applications.

Why use multifactor authentication?

SECURE APPLICATIONS AND DATA

Require additional layer of security when accessing on-premises and cloud applications.

SIMPLE TO USE

Choose from call, text, or mobile app during registration. End users can change their method anytime.
