

# Practice Graded Assignment: Course project

## ★ AI Grading

After submitting your assignment and completing your required peer reviews, you'll receive an AI-generated grade based on the assignment rubrics. You'll then have the option to have your assignment reviewed by your peers instead.

Your data will be used in accordance with [Coursera's Privacy Notice](#).

**Instructions** My submission Peers to review Discussions

In this project, you will demonstrate your ability to perform the following in Azure Active Directory (Azure AD):

- Configure Azure Active Directory Privileged Identity Management
- Implement and configure Azure policies
- Enable resource locks in Azure

You will create a **Project solution document** that documents the steps and screenshots for performing the activities for securing access with Azure Active Directory (Azure AD.) The activities include:

- Blocking access by location
- Creating access reviews
- Assigning roles to groups
- Creating locks to protect resources

At the end of this project, you will have the following deliverable for submission:

- Project solution document.docx

As part of this project, you will also review the assessment submission of two (2) peers using the peer review rubric provided.

You should budget about thirty (30) minutes to complete this project. Also, allow up to one hour to complete the graded quiz that follows the project.

## ^ Step-By-Step Assignment Instructions

### Refreshing your knowledge

Before starting on the project or while doing the project, you can refresh your knowledge by referring to the exercise/solution documents of the following lessons:

- Week 1, Lesson 1: Deploy Azure Active Directory Identity Protection
- Week 1, Lesson 2: Configure Azure Active Directory Privileged Identity Management
- Week 1, Lesson 3: Working with Azure Active Directory groups and guests in Azure Privileged Identity Management
- Week 3, Lesson 1: Role-based access control
- Week 3, Lesson 2: Monitor, maintain, and protect resources

### Project scenario

In this project, you will go through the typical activities that an Azure security engineer would perform in an organization.

Imagine you have recently joined a large organization as an Azure security engineer. The company audit has demonstrated a few security loopholes that must be fixed before the next audit. Hence, your manager has asked you to implement the following tasks as a priority. You can prioritize them logically to address dependent tasks before implementation.

- Certain cyber-attacks have originated from a specific location. It would be best if you blocked all users from the branch office until further notice with the IP range 1.38.0.0.

- The Azure AD roles in PIM need to be reviewed once every month. You have to create an access review for the administrator for one time for the current month from the 1st onward.
- A new user, "Jeff," has joined the DevOps group. You have to assign the user to the group and assign the "Virtual Machine Contributor" role to the DevOps group.
- You must add a new delete level lock so no user can delete any database server. If the database does not exist, create the lock anyway, as it will be helpful in the future.

## Setting up the system

This project consists of tasks you should complete on the Azure platform itself. Before you begin, you must have the following:

- Access to an Azure Active Directory instance as a Global Administrator
- An application such as Snipping Tool to capture screenshots
- An application such as Microsoft Word to create a document and include the steps and screenshots for the project tasks

## Guidelines for the deliverable

Follow these instructions to understand the required format of your deliverable.

We have provided a template to help you create the Project solution document. The template is called "**Project Solution Template.docx**."

- Open the template using the Project Solution Template link.

**Project Solution Template**  
DOCX File

- Create a copy of the template on your device. For example, save it on your desktop or Microsoft OneDrive.
- Give your template copy a unique file name so that you can easily find and upload it for submission later. For example, "Course 2\_Project solution document\_YourInitials."

## Guidelines for screenshots

Follow the below guidelines for screenshots:

1. Use an application such as Snipping Tool.
2. Perform a step in the task and capture the screenshot.
3. Confirm that the screenshot is clear enough to display the result of your activity. It is a good idea to set your system display resolution to 1920 × 1080.
4. You may also want to blur or remove personal information in the screenshot.
5. Copy and paste this screenshot below the appropriate step in your version of the Project solution document.
6. Save the file.

## Completing the project tasks

Follow the below instructions to create your project deliverable:

### Task 1: Block access by location

Activity: Block all users from the branch office until further notice with the IP range 1.38.0.0.

While performing this activity, take screenshots of your steps to block the users. Include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing that the users have been blocked for the specified IP range.

You can use the format in the following example to document the steps and add screenshots.

#### Example:

Task 1: Block access by location

1. Sign in to the [Azure portal](#)  with your login credentials.
2. Navigate to the **Azure Active Directory**.
3. Select the **Security** option under the **Manage** blade.

### Task 2: Create an access review of Azure AD roles in PIM

Activity: You have to create an access review for the administrator once for the current month from the 1st onward.

Remember to include the activities/steps and the associated screenshots in your copy of the Project solution document. Also, include the final screenshot showing the access review for the administrator with the specified date and frequency. Creating a well-formatted document with steps and screenshots will help your peer effectively review your assignment.

### Task 3: Assign a role to the DevOps group

Activity: You have to assign a new user, Jeff, to the DevOps group and assign the "Virtual Machine Contributor" role to the group.

Remember to include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing that the new user has been assigned the specified role.

### Task 4: Create a delete-level lock

Activity: You need to add a new delete level lock so no user can delete any database server. If the database does not exist, you can still create the lock.

Remember to include the activities/steps and the screenshots in your copy of the Project solution document. Also, include the final screenshot showing that the new delete level lock has been added.

#### ^ Finalizing your assignment

You have completed Tasks 1 to 4 and can finalize your deliverable. Ensure that you have added the steps and screenshots of all the tasks.

Remove any instruction sections or examples provided in the original deliverable template. Your final deliverable should contain only your work. You are then ready to upload your deliverable in **My submission**.

#### ^ Grading Criteria Overview

There are ten (10) points for this final project. The points are distributed across the four tasks that you have completed while developing the following deliverable:

- Project solution document (10 pts)

Your grade will be based on the following distribution of points across these tasks.

#### Task 1: Block access by location (3 pts)

Activity: You need to block all users from the branch office until further notice with the IP range 1.38.0.0.

#### Task 2: Create an access review of Azure AD roles in PIM (3 pts)

Activity: You have to create an access review for the administrator once for the current month from the 1st onward.

#### Task 3: Assign a role to the DevOps group (2 pts)

Activity: You have to assign a new user, Jeff, to the DevOps group and assign the "Virtual Machine Contributor" role to the group.

#### Task 4: Create a delete-level lock (2 pts)

Activity: You need to add a new delete level lock so no user can delete any database server. If the database does not exist, you can still create the lock.

#### ^ Preparing for project submission

Do not proceed to **My submission** and **Peers to review** until you have completed the following deliverable:

- Project solution document

Review, proofread, and edit your deliverables to be high-quality and ready to submit to your peer.

You will submit the deliverable by uploading your files to the Coursera platform, following Project Submission and Peer Review prompts.

#### ^ Peer review

Giving, receiving, and incorporating feedback is a crucial professional skill. After you submit your deliverable, in the next activity, you will review and provide feedback on submissions from two other learners. In the same process, your work will be reviewed by a peer. We've shared a rubric or review guide to help you conduct your review. You will be presented with a series of questions to answer about your peers' assignment submissions. For example, did your peer complete the activity fully? For some questions, you will provide more in-depth, written feedback. Provide constructive feedback to help your peers understand what they did well and what areas they can improve.

#### ^ Compare your work (Discussion)

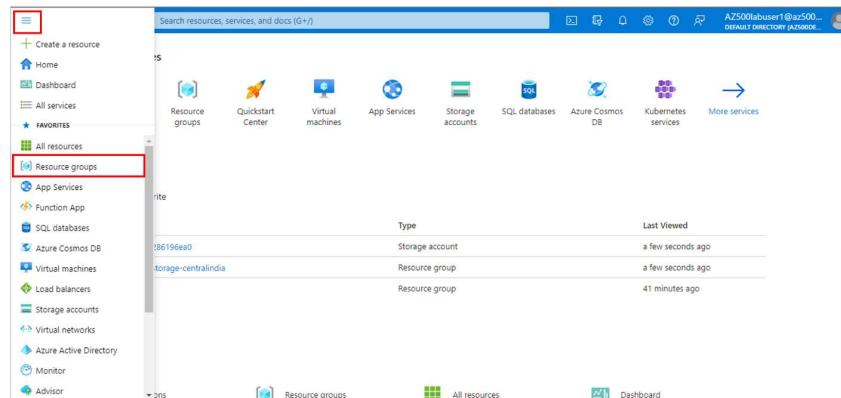

After submitting your deliverable and completing peer reviews, you can access a completed best practice sample of the Project solution document. You can compare this sample to your submission, then reflect on and share your assignment experience with other learners in a discussion.

#### ^ After completion of the project

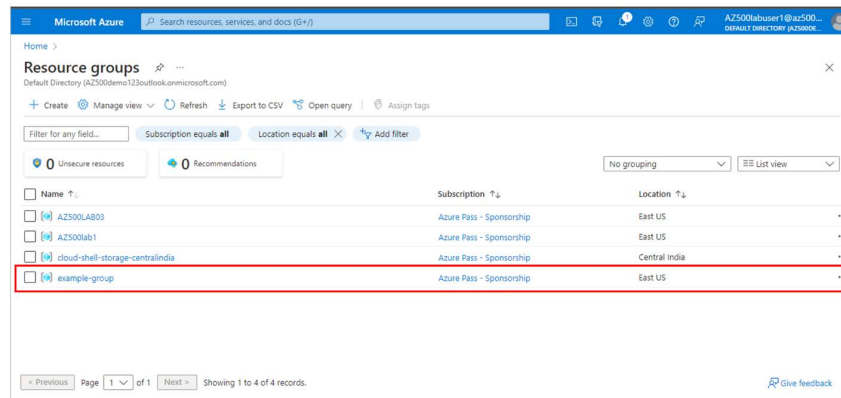

When working on your subscription, assessing whether you still require the resources you created at the end of a project is a good idea. Running resources can cost you money. You can delete resources individually or the entire resource group containing the resources. Here is how you would do this.

### Clean up the resources

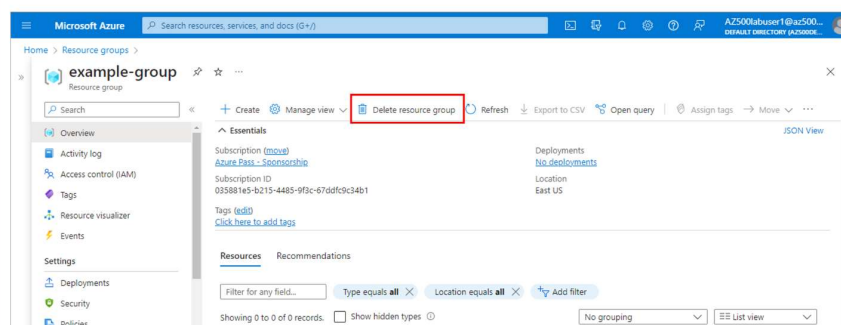

1. In the navigation list, click **Resource groups**.

2. In the list of Resource groups, select the **example-group** resource group.

3. Select **Delete resource group** to delete the resource group.
